

Table 1
Overview of Hypotheses and Empirical Results

	Hypothesis	Group means	Test statistic	p	Effect size	Outcome
H1	Startups in male-dominated industries receive more investment than startups in female-dominated industries.	2.20 vs 1.72 (n = 187)	Paired t(186) = 5.08	< .001 ^a	d _z = 0.37	Supported
H2	Male founders in male-dominated industries receive more investment than female founders in female-dominated industries.	2.13 vs 1.85 (n = 62 / 55)	Welch t(113) = 1.62	.054 ^a	d = 0.30	Marginal
H3	Among investors lower in EI, masculine-congruent startups receive more investment than feminine-congruent startups.	2.22 vs 1.76 (n = 32 / 25)	Welch t(53) = 1.89	.032 ^a	d = 0.50	Supported
H4	Among lower-EI investors without investment experience, masculine-congruent startups receive more investment than feminine-congruent startups.	2.33 vs 1.70 (n = 12 / 10)	Welch t(19) = 2.33	.031	d = 0.96	Supported
H5	Male participants score lower on emotional intelligence than female participants.	4.97 vs 5.32 (n = 84 / 100)	Welch t(180) = 3.19	.002	d = 0.47	Supported

Note. Investment measured on a 0–3 scale; emotional intelligence (EI) on the WLEIS 1–7 scale. Group means: H1 = SiteVision vs BalanceUp; H2–H4 = masculine- vs feminine-congruent; H5 = male vs female participants. d = Cohen’s d; d_z = within-subjects Cohen’s d. ^a one-tailed test (directional hypothesis). “Marginal” = directionally consistent, p just above .05. N = 187.
